Handbook of Anatomical Models for Radiation Dosimetry - Xie George Xu 2009-09-01
Over the past few decades, the radiological science community has developed and applied numerous models of the human body for radiation protection, diagnostic imaging, and nuclear medicine therapy. The Handbook of Anatomical Models for Radiation Dosimetry provides a comprehensive review of the development and application of these computational models, known as "phantoms." An
ambitious and unparalleled project, this pioneering work is the result of several years of planning and preparation involving 64 authors from across the world. It brings together recommendations and information sanctioned by the International Commission on Radiological Protection (ICRP) and documents 40 years of history and the progress of those involved with cutting-edge work with Monte Carlo Codes and radiation protection dosimetry. This volume was in part spurred on by the ICRP’s key decision to adopt voxelized computational phantoms as standards for radiation protection purposes. It is an invaluable reference for those working in that area as well as those employing or developing anatomical models for a number of clinical applications. Assembling the work of nearly all major phantom developers around the world, this volume examines: The history of the research and development in computational phantoms Detailed accounts for each of the well-known phantoms, including the MIRD-5, GSF Voxel Family Phantoms, NCAT, UF Hybrid Pediatric Phantoms, VIP-Man, and the latest ICRP Reference Phantoms Physical phantoms for experimental radiation dosimetry The smallest voxel size (0.2 mm), phantoms developed from the Chinese Visible Human Project Applications for radiation protection dosimetry involving environmental, nuclear power plant, and internal contamination exposures Medical applications, including nuclear medicine therapy, CT examinations, x-ray radiological image optimization, nuclear medicine imaging, external photon and proton treatments, and management of respiration in modern image-guided radiation treatment Patient-specific phantoms used for radiation treatment planning involving two Monte Carlo code systems: GEANT4 and EGS Future needs for research and development Related data sets are available for download on the authors’ website. The breadth and depth of this work enables readers to obtain a unique sense of the complete scientific process in
computational phantom development, from the conception of an idea, to the identification of original anatomical data, to solutions of various computing problems, and finally, to the ownership and sharing of results in this groundbreaking field that holds so much promise.

Workshop Physics Activity Guide is a student workbook designed to serve as the foundation for a two-semester calculus-based introductory physics course sequence that is activity-centered. It consists of 28 units that interweave text materials with activities that include prediction, qualitative observation, explanation, equation derivation, mathematical model building, quantitative experiments, and problem solving. Students use a powerful set of computer tools to record, display and analyze data as well as to develop mathematical models of physical phenomena. The design of many of the activities is based on the outcomes of physics education research. Workshop Physics Activity Guide is available in a format designed to give instructors flexibility in integrating all or some of the Workshop Physics units into their curriculum. The Core Volume (ISBN 0-471-15593-4) includes the introductory chapters and appendices that provide the foundation for all the other activity-based units. It includes the first seven activity units (Module1) comprising the first half of mechanics which covers experimental uncertainty, kinematics, and Newton's Laws. The remaining activity units are available in
three independent Modules. Each module is a collection of loose-leaf, three-hole punched sheets. Module 2 (ISBN 0-471-15594-2) covers additional topics in mechanics including momentum, energy, rotation, oscillations, and chaos. Module 3 (ISBN 0-471-15595-0) covers thermodynamics and nuclear radiation. Module 4 (ISBN 0-471-15596-9) covers electricity and magnetism. The Workshop Physics Activity Guide approach is supported by an Instructor's Manual that (1) describes the underlying history and philosophy of the Workshop Physics Project; (2) provides advice and suggestions on how to integrate the Guide into a variety of educational settings; (3) provides information on computer tools (hardware and software) as well as apparatus; and (4) includes suggested homework assignments for each unit. The Guide includes activities especially designed to be used with digital video capture tools and analysis software such as VideoPoint. Developed by the authors and available from PASCO Scientific, VideoPoint enhances the students' ability to observe and understand two-dimensional motion and other phenomena. For more information on the Workshop Physics Activity Guide and VideoPoint, please log on to the Workshop Physics Project Home page at "http://physics.dickinson.edu/" or the John Wiley & Sons home page at "http://www.wiley.com"
