Nervous System Kristin Petrie,2006-08-15 Through engaging easy to read text young readers learn that the human body s nervous system is like a supercomputer that coordinates all of the body s actions and reactions Both the central nervous system and the peripheral nervous system as well as their parts are discussed Readers discover that the brain and the spinal cord make up the central nervous system and that the spinal cord connects the brain to the peripheral nervous system which contains all the nerves in the body The book explains that the nervous system makes the heart beat keeps us breathing and allows us to see and read The brain s various parts the cerebrum the cerebellum the brain stem the hippocampus the pituitary gland and the hypothalamus are also discussed as well as the functions of these various parts including control of our voluntary and involuntary muscles control of our memory sending growth hormones throughout the body and regulating the body s temperature A detailed diagram of a labeled neuron is included Kid friendly text and a graphic explanation describe how pain messages throughout the body Senses reflexes and diseases that cause the nervous system to function improperly such as multiple sclerosis and epilepsy are also discussed Common brain and spinal cord injuries and the ways to avoid these injuries are also highlighted Readers also learn about the nutrients necessary to keep the nervous system working properly These include glucose fat protein vitamins and minerals Full color photos detailed diagrams medical models phonetics glossary and index enhance the text

Neurons, Networks, and Motor Behavior Paul S. G. Stein,1997 Recent advances in motor behavior research rely on detailed knowledge of the characteristics of the neurons and networks that generate motor behavior At the cellular level Neurons Networks and Motor Behavior describes the computational characteristics of individual neurons and how these characteristics are modified by neuromodulators At the network and behavioral levels the volume discusses how network structure is dynamically modulated to produce adaptive behavior Comparisons of model systems throughout the animal kingdom provide insights into general principles of motor control Contributors describe how networks generate such motor behaviors as walking swimming flying scratching reaching breathing feeding and chewing An emerging principle of organization is that nervous systems are remarkably efficient in constructing neural networks that control multiple tasks and dynamically adapt to change The volume contains six sections selection and initiation of motor patterns generation and formation of motor patterns cellular and systems properties generation and formation of motor patterns computational approaches modulation and reconfiguration short term modulation of pattern generating circuits and

Discovering the Brain National Academy of Sciences,Institute of Medicine,Sandra Ackerman,1992-01-01 The brain There is no other part of the human anatomy that is so intriguing How does it develop and function and why does it sometimes tragically degenerate The answers are complex In Discovering the Brain science writer Sandra Ackerman cuts through the complexity to bring this vital topic to the public The 1990s were declared the Decade of the Brain by former President Bush and the neuroscience community responded with a host of new investigations and conferences Discovering the Brain is based on the Institute of Medicine conference Decade of the Brain Frontiers in Neuroscience and Brain Research Discovering the Brain is a field guide to the brain an easy to read discussion of the brain s physical structure and where functions such as language and music appreciation lie Ackerman examines How electrical and chemical signals are conveyed in the brain The mechanisms by which we see hear think and pay attention and how a gut feeling actually originates in the brain Learning and memory retention including parallels to computer memory and what they might tell us about our own mental capacity Development of the brain throughout the life span with a look at the aging brain Ackerman provides an enlightening chapter

on the connection between the brain's physical condition and various mental disorders and notes what progress can realistically be made toward the prevention and treatment of stroke and other ailments Finally she explores the potential for major advances during the Decade of the Brain with a look at medical imaging techniques what various technologies can and cannot tell us and how the public and private sectors can contribute to continued advances in neuroscience This highly readable volume will provide the public and policymakers and many scientists as well with a helpful guide to understanding the many discoveries that are sure to be announced throughout the Decade of the Brain

Motor Neuron Disease Research Progress Raffaele L. Mancini,2008 The motor neuron diseases or motor neuron diseases MND are a group of progressive neurological disorders that destroy motor neurons the cells that control voluntary muscle activity such as speaking walking breathing and swallowing Neurological examination presents specific signs associated with upper and lower motor neuron degeneration Signs of upper motor neuron damage include spasticity brisk reflexes and the Babinski sign Signs of lower motor neuron damage include weakness and muscle atrophy Every muscle group in the body requires both upper and lower motor neurons to function It is a common misconception that upper motor neurons control the arms while lower motor neurons control the legs The signs described above can occur in any muscle group including the arms legs torso and bulbar region Symptoms usually present between the ages of 50 70 and include progressive weakness muscle wasting and muscle fasciculations spasticity or stiffness in the arms and legs and overactive tendon reflexes Patients may present with symptoms as diverse as a dragging foot unilateral muscle wasting in the hands or slurred speech This new book presents the latest research from around the globe

Colonic Motility Sushil K. Sarna, 2010-11-01 Three distinct types of contractions perform colonic motility functions Rhythmic phasic contractions RPCs cause slow net distal propulsion with extensive mixing turning over Infrequently occurring giant migrating contractions GMCs produce mass movements Tonic contractions aid RPCs in their motor function The spatiotemporal patterns of these contractions differ markedly The amplitude and distance of propagation of a GMC are several fold larger than those of an RPC The enteric neurons and smooth muscle cells are the core regulators of all three types of contractions The regulation of contractions by these mechanisms is modifiable by extrinsic factors CNS autonomic neurons hormones inflammatory mediators and stress mediators Only the GMCs produce descending inhibition which accommodates the large bolus being propelled without increasing muscle tone The strong compression of the colon wall generates afferent signals that are below nociceptive threshold in healthy subjects However these signals become nociceptive if the amplitudes of GMCs increase afferent nerves become hypersensitive or descending inhibition is impaired The GMCs also provide the force for rapid propulsion of feces and descending inhibition to relax the internal anal sphincter during defecation The dysregulation of GMCs is a major factor in colonic motility disorders irritable bowel syndrome IBS inflammatory bowel disease IBD and diverticular disease DD Frequent mass movements by GMCs cause diarrhea in diarrhea predominant IBS IBD and DD while a decrease in the frequency of GMCs causes constipation The GMCs generate the afferent signals for intermittent short lived episodes of abdominal cramping in these disorders Epigenetic dysregulation due to adverse events in early life is one of the major factors in generating the symptoms of IBS in adulthood
